| <b>3. Loading the programme list onto the USB stick</b> | <b>Page 4</b> |

## 1. Preparing the USB stick

First of all one must ensure that the USB stick to be used has been formatted to the file system FAT or FAT 32.

**Note: All files on the USB stick will be deleted. Please ensure that you save required data beforehand.**

Once the formatting has been carried out, the USB stick can now be prepared for the update process. To do this one must create a specific file structure on the USB stick:

Main file:           kathrein  
Sub file:            └───▶ channellist

**Hereby one must absolutely ensure that all files or file names must be written in low case letters and written without any gaps between words!**

The various possibilities available to carry out an update will be described in the following sections in detail.

### **Important:**

**Programme list loading will only be successful if the USB stick is only connected to one partition.**

## 2. Loading the programme list onto a receiver

First of all one must re-name the programme list that has been downloaded from our website as follows:

„Channellist\_in.xml“

This file must now be copied into the the file „channellist“ on the USB stick.

The following procedure must be carried out when loading onto a receiver:

- Switch the UFS 910 on
- Connect the USB stick to the receiver (front USB)
- Press down on the menu button on the remote control
- Now enter **4 4 4** using the numerical keys
- The programme list loading process will commence
  - o The following reports will be displayed:
    - UPLOAD XX %           => Programme list is being loaded
    - UPLOAD DONE           => The programme list was successfull loaded
- Now leave the menu using the Exit button

The programme list has now been successfully loaded onto the receiver and can be used immediately.

If the loading process was not successfull then the following report may be displayed:

- „CAN'T OPEN FILE“ => i.e. false file structure on the USB stick => check this on the PC again (high and small case letters).

### 3. Loading the programme list from the receiver to the USB stick

First of all, as described under point 1, set up the required file structure on the USB stick.

The following procedure is to be followed to load files onto the USB stick:

- Switch on the UFS 910
- Connect up the USB stick (front USB)
- Press down the menu button on the remote control
- Now enter **1 1 1** using the numerical keys on the remote control
- Programme list loading will commence
  - o The following reports will be displayed:
    - DOWNLOAD => Loading in process
    - DOWNLOAD DONE => Programme list successfully loaded
- Now leave the menu using the Exit key

Loading the programme list onto the USB stick is now completed.

The file „Channelist\_out.xml“ is now in the file „channellist“ on the USB stick. This can now be edited using the UFS 910's DVR manager programme.

Should the process loading the programme list onto the USB stick be unsuccessful, then the following report may be displayed:

- „CAN'T OPEN FILE“ => i.e. false file structure on the USB stick → Please check this again on your PC (high and low case lettering).
